

```
#mkdir -p src/main/scala/
```

---

Actual code section:

```
#cd src/main/scala/
```

Write the code as shown below in a file, NameList.scala in the same folder.

```
import org.apache.spark.sql.SparkSession
object NameList {
    def main(args: Array[String]) {
        if (args.length < 2) {
            System.err.println(
                "Usage: NameList <input-file> <output-file>")
            System.exit(1)
        }
        val spark = SparkSession.builder.getOrCreate()
        spark.sparkContext.setLogLevel("WARN")
        val peopleDF = spark.read.json(args(0))
        val namesDF = peopleDF.select("firstName", "lastName")
        namesDF.write.option("header", "true").csv(args(1))
        spark.stop
    }
}
```

Change to the directory where build.sbt is located.

```
# cd /opt/spark-sbt
```

```
# Package a jar containing your application
```

```
$ sbt package
```

Usually take sometimes to download all the packages depending on the speed, usually 5 to 10 minutes.

----- Lab Ends Here -----

**16. Spark Standalone Cluster – 60 Minutes.**

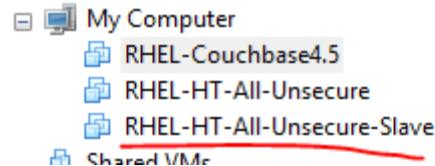

You will learn to configure two nodes Spark Standalone Cluster.

Create another instance of the VM by copying the VM folder or making clone. You need to shutdown the VM for that.

If you use clone, then specify as shown below. Hints: Select the parent virtual machine and select VM > Manage > Clone.

It will take few minutes depending on your VM size.

At the end, you will get an additional VM as shown below: (ex)

You need to power on both VM at this step.

Add another node i.e slave node to the Cluster. Change the hostname of the slave node, slave.

Logon to the slave VM. Your slave node should be as shown below.

```
[root@slave sbin]#  
[root@slave sbin]# hostname  
slave  
[root@slave sbin]#
```

Ensure to provide entries in /etc/hosts of both the VMs, so that it can communicate each other's using hostname.

*192.168.188.178 master  
192.168.188.174 slave*

Logon to the first VM i.e master to configure password less connection between the nodes.  
SSH access

The root user on the master must be able to connect

- a) to its own user account on the master – i.e. ssh master in this context and not necessarily ssh localhost – and
- b) to the root user account on the slave via a password-less SSH login.

You have to add the root@master's public SSH key (which should be in \$HOME/.ssh/id\_rsa.pub) to the authorized\_keys file of root@slave (in this user's \$HOME/.ssh/authorized\_keys).

The following steps will ensure that root user can ssh to its own account without password in all nodes.

Let us generate the keys for user root on the master node, to make sure that root user on master can ssh to slave nodes without password.

```
$ su - root  
$ ssh-keygen -t rsa -P "" -f ~/.ssh/id_rsa
```

```
$cat ~/.ssh/id_rsa.pub >> ~/.ssh/authorized_keys  
$ ssh master  
You need to accept the key for the first time.
```

You can do this manually or use the following SSH command: to copy public key to all the slave nodes.

```
$ ssh-copy-id -i $HOME/.ssh/id_rsa.pub root@slave
```

Accept it, yes and supply the root password for the last time.

This command will prompt you for the login password for user root on slave, then copy the public SSH key for you, creating the correct directory and fixing the permissions as necessary.

The final step is to test the SSH setup by connecting with user root from the master to the user account root on the slave. This step is also needed to save slave's host key fingerprint to the root@master's known\_hosts file.

So, connecting from master to master...

```
$ ssh master
```

And from master to slave.

```
$ ssh slave
```

```
[root@master sbin]# ssh-keygen -t rsa -P ""
Generating public/private rsa key pair.
Enter file in which to save the key (/root/.ssh/id_rsa):
/root/.ssh/id_rsa already exists.
Overwrite (y/n)? y
Your identification has been saved in /root/.ssh/id_rsa.
Your public key has been saved in /root/.ssh/id_rsa.pub.
The key fingerprint is:
dd:87:61:51:6e:f9:1e:88:70:a0:ff:f6:92:e5:7f:fb root@master
The key's randomart image is:
---[ RSA 2048]---
+----+ . . .

+-----+
[root@master sbin]# scp
usage: scp [-1246BCpqrv] [-c cipher] [-F ssh_config] [-i identity_file]
           [-l limit] [-o ssh_option] [-P port] [-S program]
           [[user@]host1:]file1 ... [[user@]host2:]file2
[root@master sbin]# cat ~/.ssh/id_rsa.pub >> ~/.ssh/authorized_keys
[root@master sbin]# ssh master
Last login: Thu Sep  1 23:45:46 2016 from localhost
[root@master ~]# ssh-copy-id -i $HOME/.ssh/id_rsa.pub root@slave
root@slave's password:
Now try logging into the machine, with "ssh 'root@slave'", and check in:

.ssh/authorized_keys

to make sure we haven't added extra keys that you weren't expecting.

[root@master ~]# ssh slave
Last login: Thu Sep  1 23:45:46 2016 from localhost
[root@slave ~]#
```

Go to SPARK\_HOME/conf/ and create new file with name spark-env.sh on the master node

*There will be **spark-env.sh.template** in same folder and this file gives you detail on how to declare various environment variables.*

Now we will give the IP address of Master.

**SPARK\_LOCAL\_IP=192.168.188.173**

**SPARK\_MASTER\_HOST={IP Address}**

```
# Options read by executors and drivers running inside the cluster
# - SPARK_LOCAL_IP, to set the IP address Spark binds to on this node
SPARK_LOCAL_IP=192.168.188.173
# - SPARK_PUBLIC_DNS, to set the public DNS name of the driver program
# - SPARK_CLASSPATH, default classpath entries to append
# - SPARK_LOCAL_DIRS, storage directories to use on this node for shuffle and RD

# Options for the daemons used in the standalone deploy mode
# - SPARK_MASTER_HOST, to bind the master to a different IP address or hostname
SPARK_MASTER_HOST=192.168.188.173
# - SPARK_MASTER_PORT / SPARK_MASTER_WEBUI_PORT, to use non-default ports for the master
# - SPARK_DAEMON_MEMORY, memory allocated for each daemon process
# - SPARK_WORKER_CORES, number of cores to use for workers
# - SPARK_WORKER_MEMORY, memory allocated for workers
# - SPARK_WORKER_DIR, storage directory to use for workers
# - SPARK_WORKER_INSTANCES, number of worker instances to start on this host
# - SPARK_DAEMON_JAVA_OPTS, Java options for the daemons
# - SPARK_WORKER_JAVA_OPTS, Java options for workers
```

**// Note: You need to specify IP only.**

On master node; Create SPARK\_HOME/conf/slaves and enter the following entries.

Worker process will be started in both the nodes.

```
[root@master conf]# more slaves
slave
master
[root@master conf]#
```

Then go to Spark HOME\_DIRECTORY/sbin and run following command from terminal

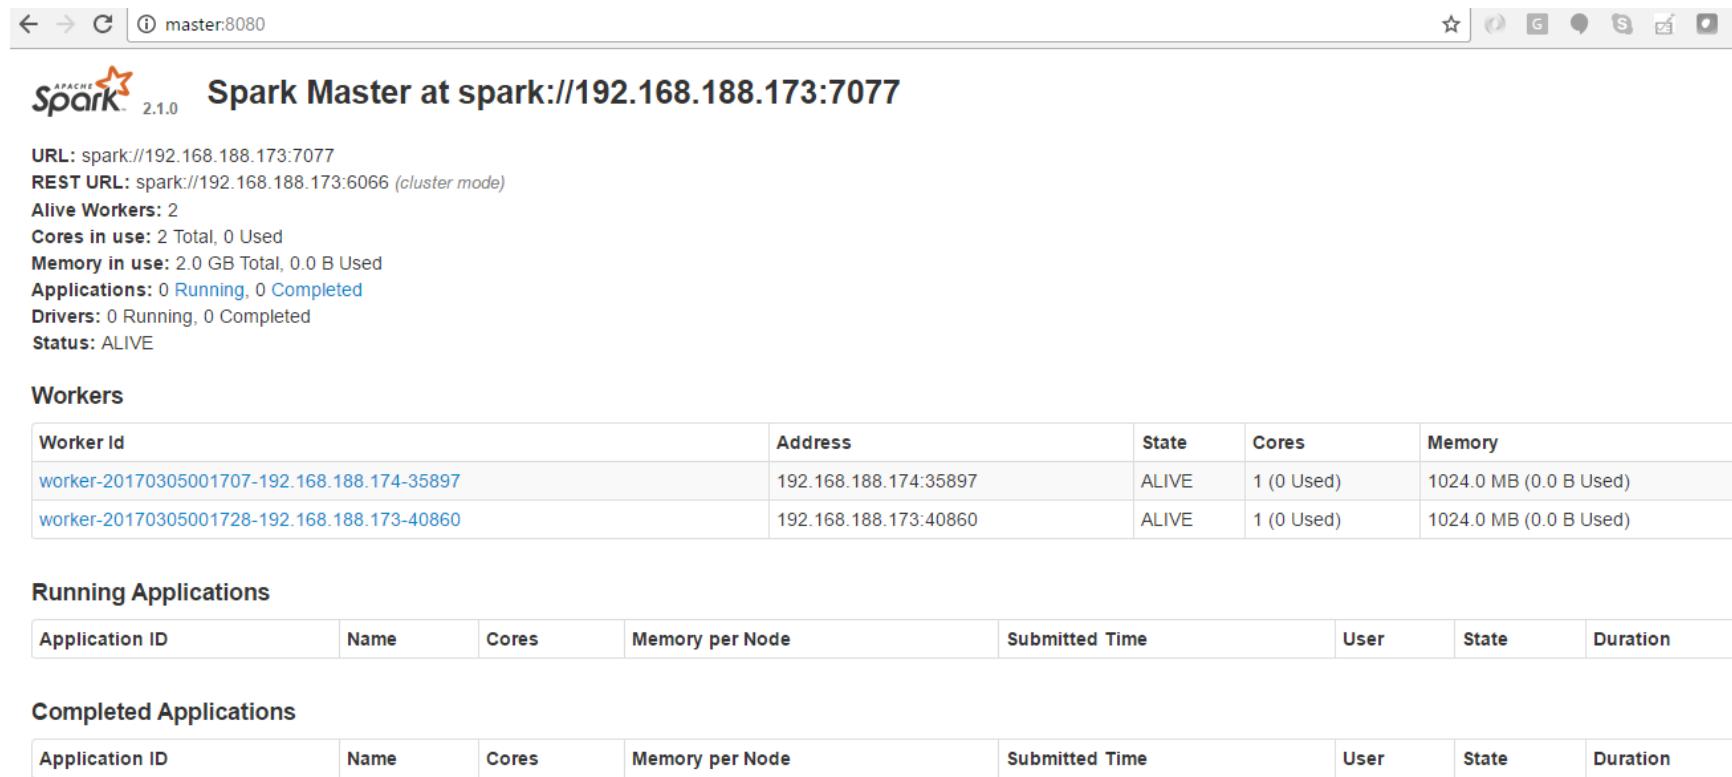

sh sbin/start-all.sh

```
[root@master sbin]# sh start-all.sh
starting org.apache.spark.deploy.master.Master, logging to /spark/spark-2.1/logs
/spark-root-org.apache.spark.deploy.master.Master-1-master.out
slave: starting org.apache.spark.deploy.worker.Worker, logging to /spark/spark-2
.1/logs/spark-root-org.apache.spark.deploy.worker.Worker-1-slave.out
master: starting org.apache.spark.deploy.worker.Worker, logging to /spark/spark-
2.1/logs/spark-root-org.apache.spark.deploy.worker.Worker-1-master.out
master: failed to launch: nice -n 0 /spark/spark-2.1/bin/spark-class org.apache.
spark.deploy.worker.Worker --webui-port 8081 spark://192.168.188.173:7077
master: full log in /spark/spark-2.1/logs/spark-root-org.apache.spark.deploy.wor
ker.Worker-1-master.out
```

This will start a standalone master server by executing it

<http://master:8080/>

You can access the Spark Master with the above URL.

The screenshot shows the Apache Spark 2.1.0 master web UI at `spark://192.168.188.173:7077`. The UI displays cluster statistics, lists of workers and applications, and a completed applications section.

**Cluster Statistics:**

- URL: `spark://192.168.188.173:7077`
- REST URL: `spark://192.168.188.173:6066 (cluster mode)`
- Alive Workers: 2
- Cores in use: 2 Total, 0 Used
- Memory in use: 2.0 GB Total, 0.0 B Used
- Applications: 0 Running, 0 Completed
- Drivers: 0 Running, 0 Completed
- Status: ALIVE

**Workers**

Worker Id	Address	State	Cores	Memory
worker-20170305001707-192.168.188.174-35897	192.168.188.174:35897	ALIVE	1 (0 Used)	1024.0 MB (0.0 B Used)
worker-20170305001728-192.168.188.173-40860	192.168.188.173:40860	ALIVE	1 (0 Used)	1024.0 MB (0.0 B Used)

**Running Applications**

Application ID	Name	Cores	Memory per Node	Submitted Time	User	State	Duration

**Completed Applications**

Application ID	Name	Cores	Memory per Node	Submitted Time	User	State	Duration

Once started, the master will print out a `spark://HOST:PORT` URL for itself, which you can use to connect workers to it, or pass as the “master” argument to `SparkContext`. You can also find this URL on the master’s web UI, which is `http://localhost:8080` by default. Once you have started a worker, look at the master’s web UI (`http://localhost:8080` by default). You should see the new node listed there, along with its number of CPUs and memory (minus one gigabyte left for the OS). In our case its 2 node.

Then you can verify the Node using the master UI:

**Workers**

Worker Id	Address	State	Cores	Memory
worker-20170305001707-192.168.188.174-35897	192.168.188.174:35897	ALIVE	1 (0 Used)	1024.0 MB (0.0 B Used)
worker-20170305001728-192.168.188.173-40860	192.168.188.173:40860	ALIVE	1 (0 Used)	1024.0 MB (0.0 B Used)

Let us execute Spark shell using Cluster mode:

You can perform from any client/server node i.e windows desktop client.

Connecting an Application to the Cluster

To run an application on the Spark cluster, simply pass the spark://IP:PORT URL of the master as to the SparkContext constructor.

To run an interactive Spark shell against the cluster, run the following command from the bin folder:

We are executing from the slave node.

```
#bin/spark-shell --master spark://192.168.173:8090
```

You can verify the application execution from the web UI

**Spark Master at spark://192.168.188.173:7077**

**URL:** spark://192.168.188.173:7077  
**REST URL:** spark://192.168.188.173:6066 (cluster mode)  
**Alive Workers:** 2  
**Cores in use:** 2 Total, 2 Used  
**Memory in use:** 2.0 GB Total, 2.0 GB Used  
**Applications:** 1 Running, 0 Completed  
**Drivers:** 0 Running, 0 Completed  
**Status:** ALIVE

**Workers**

Worker Id	Address	State	Cores	Memory

0.011 s
15/06/03 23:34:06 INFO TaskSchedulerImpl: Removed TaskSet 1.0, whose tasks have
all completed, from pool
15/06/03 23:34:06 INFO DAGScheduler: Job 1 finished: first at <console>:24, took
0.019875 s
res3: String = # Apache Spark
scala>
```

Now let's use a transformation. We will use the `filter` transformation to return a new RDD with a subset of the items in the file.

scala> `val linesWithSpark = textFile.filter(line => line.contains("Spark"))`

We can chain together transformations and actions:

scala> `textFile.filter(line => line.contains("Spark")).count() // How many lines contain "Spark"?`

```
15/06/03 23:35:17 INFO Executor: Finished task 0.0 in stage 2.0 (TID 3). 1830 by

res4: Long = 19
scala>
```

Let's say we want to find the line with the most words

```
scala> textFile.map(line => line.split(" ").size).reduce((a, b) => if (a > b) a else b)
```

Stop the spark process. Hints [sbin/stop-all.sh]

----- Lab Ends Here -----

**17. Spark Two Nodes Cluster Using Docker – 120 Minutes**

Prerequisites:

- Install Docker
- Pull Centos Image (Preferable spark kafka Image)

Steps for deploying two node spark cluster in docker:

- Create two containers using the above image
  - o Spark0
  - o Spark1
- Create a network to connect between these two nodes.

You should pull the following images from docker hub.

```
(base) Henrys-MacBook-Air:~ henrypotsangbam$ docker images
REPOSITORY          TAG      IMAGE ID      CREATED       SIZE
spark-kafka         latest   a0c16a0aebc1  2 days ago   3.84GB
centos              7        7e6257c9f8d8  4 weeks ago  203MB
(base) Henrys-MacBook-Air:~ henrypotsangbam$
```

Let us create a common network for our two nodes cluster.

```
#docker network create --driver bridge spark-net
```

Create first node, sparko container

```
#docker run -it --name sparko --privileged -p 8080:8080 -p 7077:7077 -p 4040:4040 -p 8081:8081 -p 8090:8090 centos:7 /usr/sbin/init
```

Docker command with Host folder mounted. (Skip)

```
# docker run -it --name spark0 --hostname spark0 --privileged --network spark-net -v /Users/henrypotsangbam/Documents/Docker:/opt -p 8080:8080 -p 7077:7077 -p 4040:4040 -p 8081:8081 -p 8090:8090 centos:7 /usr/sbin/init
```

[ Alternative Optional: Skip this step.

```
#docker create -it --name sparko --privileged -p 8080:8080 -p 7077:7077 -p 4040:4040 -p 8081:8081 -p 8090:8090 --network spark-net --entrypoint /usr/sbin/init centos:7
```

or use tag - spark-kafka

]

To connect a **running** container to an existing user-defined bridge, use the docker network connect command. If the sparko is already started without the network being attached execute the following else skip the following step.

```
$ docker network connect spark-net sparko
```

Start the first container:

```
#docker start sparko
```

Connect to you first node:

```
# docker exec -it sparko /usr/bin/bash
```

Start the second node and perform the installation as specify in the first lab.

```
#docker run -dit --name spark1 -p 8082:8081 -p 4041:4040 --network spark-net --entrypoint /bin/bash centos:7
```

or

Docker command with Host folder mounted. (Skip)

```
# docker run -it --name spark1 --hostname spark1 --privileged --network spark-net -v /Users/henrypotsangbam/Documents/Docker:/opt -p 4041:4040 -p 8082:8081 centos:7 /usr/sbin/init
```

Confirm the Network status:

Inspect the network and find the IP addresses of the two containers

```
#docker network inspect spark-net
```

```
    "ConfigOnly": false,
    "Containers": [
        "e34277dc489b480dd6fb4528c84a333a40a322c054be3877da827005a84f593e": {
            "Name": "spark1",
            "EndpointID": "d5c0c550a1b58782b590909ffb56e3c66826d4ccb046853fbe7c4f5646239038",
            "MacAddress": "02:42:ac:13:00:03",
            "IPv4Address": "172.19.0.3/16",
            "IPv6Address": ""
        },
        "ef2232096b600d78c553dc7cab22b8b0bbdb7065d2d59eb57637d36699839ac7": {
            "Name": "spark0",
            "EndpointID": "e3bfa88d7a67b2f6b82cd2543637eee22abcaeeb9c8ff1c00415d47308d96da8",
            "MacAddress": "02:42:ac:13:00:02",
            "IPv4Address": "172.19.0.2/16",
            "IPv6Address": ""
        }
    ],
    ...
}
```

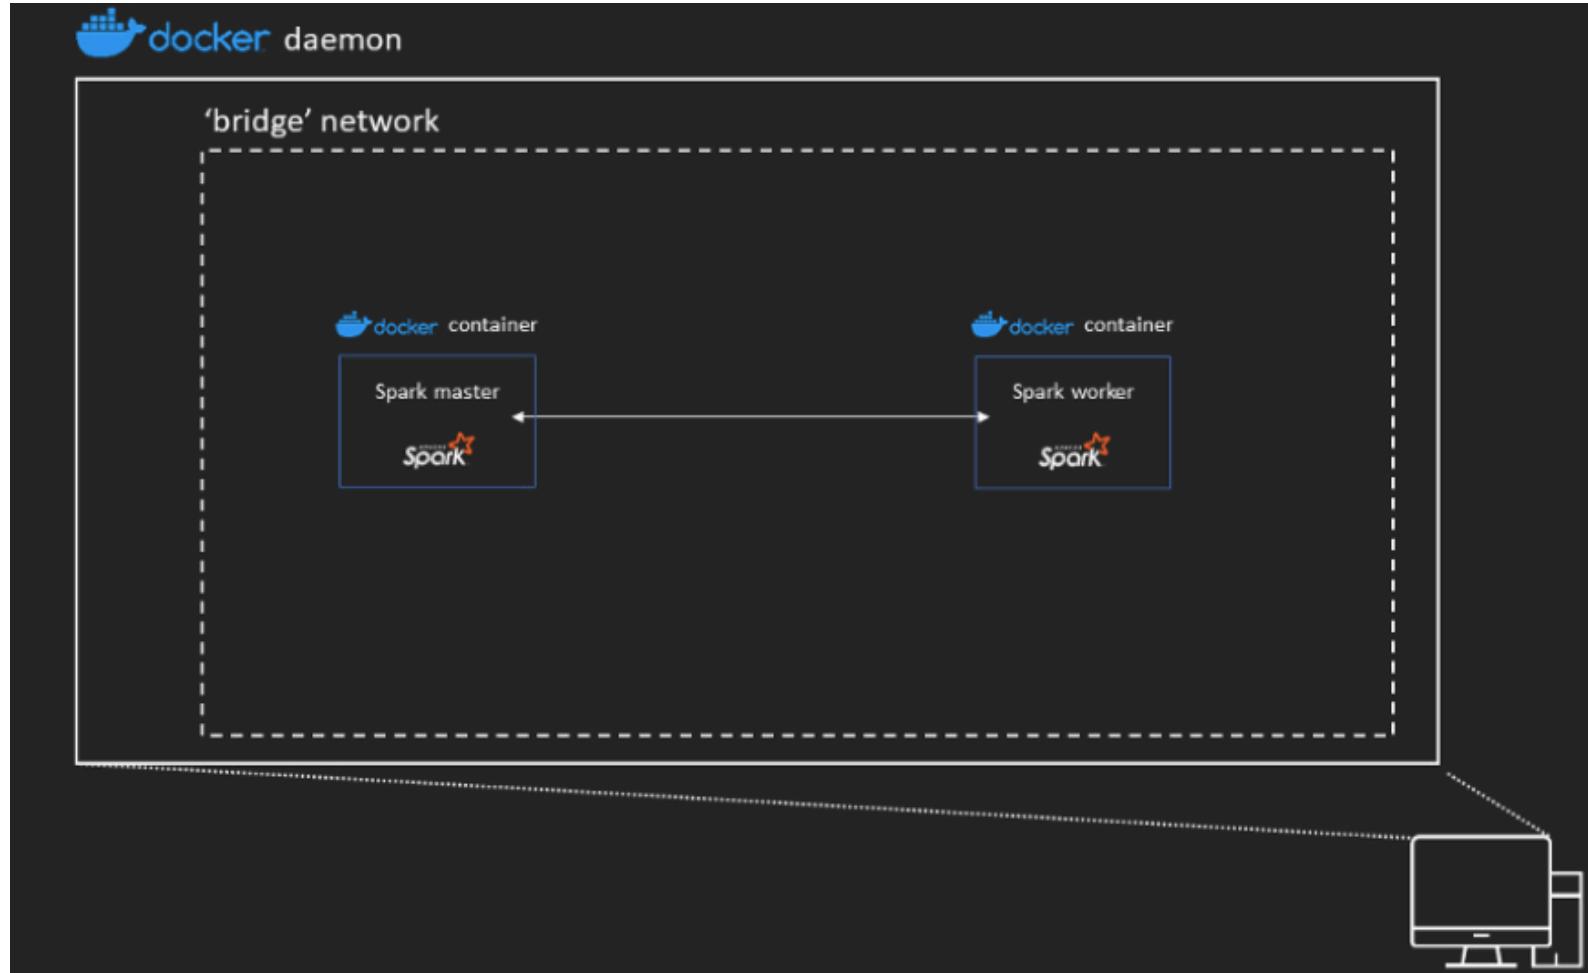

Ensure to substitute IPs accordingly.

Attach to the spark-master container and test its communication to the spark-worker container using both it's IP address and then using its container name.

```
# ping spark0
```

```
[root@ef2232096b60 /]# ping spark0
PING spark0 (172.19.0.2) 56(84) bytes of data.

#[root@ef2232096b60 /]#
```

## Architecture

master – spark0 and Slave – spark1

Let us start the Spark master.

Install the spark. You can refer the first lab.

Execute the following in Sparko

Setup a Spark master node

Change the Master Port to 8090, there is issue when it is executed in 7077 in docker environment.

Execute on the sparko – Terminal.

```
#export PATH=$PATH:/opt/spark/bin  
#export SPARK_MASTER_PORT=8090  
#spark-class org.apache.spark.deploy.master.Master
```

```
@5d486484cd1c:/software (docker)          361           bash          362

```

Start a worker process On Node/spark o: In a separate terminal.

Attach a worker node to the cluster, execute the following in the sparko container.

```
#export PATH=$PATH:/opt/spark/bin
```

```
#spark-class org.apache.spark.deploy.worker.Worker -c 1 -m 1G spark://172.17.0.2:8090
```

You need to replace with the IP of the sparko node. It can be retrieve using ifconfig command.

```
20/09/12 02:55:17 INFO Worker: Starting Spark worker 172.17.0.2:38483 with 1 cores, 2.0 GiB RAM

```

If unable to connect to localhost replace it with the container IP or the container alias i.e sparko.

Refresh the web ui, ensure that you can see a worker as shown below.

<http://127.0.0.1:8080>

The screenshot shows the Spark Web UI interface. At the top, there is a header with the Spark logo and the text "Spark Master at spark://172.17.0.2:8090". Below the header, there is a summary of system resources:

- URL: spark://172.17.0.2:8090
- Alive Workers: 1
- Cores in use: 1 Total, 0 Used
- Memory in use: 1024.0 MiB Total, 0.0 B Used
- Resources in use:
- Applications: 0 Running, 0 Completed
- Drivers: 0 Running, 0 Completed
- Status: ALIVE

Below the summary, there is a section titled "Workers (1)" which contains a table with one row of data:

Worker Id	Address	State	Cores	Memory	Resources
worker-20210118134218-172.17.0.2-34667	172.17.0.2:34667	ALIVE	1 (0 Used)	1024.0 MiB (0.0 B Used)	

There are also sections for "Running Applications (0)" and "Completed Applications (0)", each with its own table header.

Start the Node on spark1

Ensure that you have install spark in the Spark1 too.

```
#docker exec -it spark1 bash
```

```
#export PATH=$PATH:/opt/spark/bin  
# spark-class org.apache.spark.deploy.worker.Worker -c 1 -m 1G spark://172.17.0.2:8090
```

At the end of this step, you should have 2 worker nodes as shown below:

The screenshot shows the Spark 3.0.1 master UI at `spark://172.19.0.3:8090`. The top section displays cluster statistics: URL: `spark://172.19.0.3:8090`, Alive Workers: 2, Cores in use: 2 Total, 0 Used, Memory in use: 2.0 GiB Total, 0.0 B Used. It also lists Resources in use, Applications (0 Running, 0 Completed), Drivers (0 Running, 0 Completed), and Status: ALIVE.

**Workers (2)**

Worker Id	Address	State	Cores	Memory	Resources
worker-20200912142723-172.19.0.3-35677	172.19.0.3:35677	ALIVE	1 (0 Used)	1024.0 MiB (0.0 B Used)	
worker-20200912142924-172.19.0.2-38199	172.19.0.2:38199	ALIVE	1 (0 Used)	1024.0 MiB (0.0 B Used)	

**Running Applications (0)**

Application ID	Name	Cores	Memory per Executor	Resources Per Executor	Submitted Time	User	State	Duration

**Completed Applications (0)**

Application ID	Name	Cores	Memory per Executor	Resources Per Executor	Submitted Time	User	State	Duration

Open a scala shell and connect to the Spark cluster

```
#SPARK_HOME/bin/spark-shell --conf spark.executor.memory=512mb --conf
spark.executor.cores=1 --master spark://spark0:8090
```

Run an example job in the interactive scala shell

```
val myRange = spark.range(100).toDF("number")
val divisBy2 = myRange.where("number % 2 = 0")
```

`divisBy2.count()`

Check the application UI by navigating to <http://localhost:4040>. You should see the following

The console should display the result as shown below:

```
Spark session available as 'spark'.
Welcome to

    __
   / \_ \_ _ _ _ / \_
  \ V _ V _ \ / \ /
 / \_ . \_, / / / \ \_ \
   / \_ \_ \_ \_ \_ \_ \_ \
version 3.0.1

Using Scala version 2.12.10 (Java HotSpot(TM) 64-Bit Server VM, Java 14.0.2)
Type in expressions to have them evaluated.
Type :help for more information.

scala> val myRange = spark.range(100).toDF("number")
myRange: org.apache.spark.sql.DataFrame = [number: bigint]

scala> val divisBy2 = myRange.where("number % 2 = 0")
divisBy2: org.apache.spark.sql.Dataset[org.apache.spark.sql.Row] = [number: bigint]

scala> divisBy2.count()
res0: Long = 50

scala> 
```

Hints: (For submitting job in cluster)

You need to complete the **Lab - Running a Spark Application** before going ahead.  
Submit from the /software folder, since the input file exist in that folder.

Copy the names.json in /software folder

```
# export PATH=$PATH:/opt/spark/bin  
  
#spark-submit --class "NameList" --master spark://sparko:8090 simple-project_2.12-  
1.0.jar names.json mynames --conf spark.executor.memory=256mb
```

Verify the output.

```
#ls /software/mynames  
  
_temporary part-00000-ba4c474e-4f80-4824-83e7-4dc8d47cc79b-c000.csv  
  
#more part-00000-ba4c474e-4f80-4824-83e7-4dc8d47cc79b-c000.csv  
  
firstName,lastName  
Grace,Hopper  
Alan,Turing  
Ada,Lovelace  
Charles,Babbage  
Optional only for Java.
```

```
#spark-submit --class "com.ostech.spark.SimpleApp" --master spark://sparko:8090  
LearningSpark-0.0.1-SNAPSHOT.jar --conf spark.executor.memory=256mb
```

----- Lab Ends Here -----  
-----

<https://towardsdatascience.com/diy-apache-spark-docker-bb4f11c10d24>

**18. Launching on a Cluster: Hadoop YARN – 120 Minutes**

In this lab, you will deploy Spark Application on Hadoop Cluster.

Configure and install YARN.

One Node will be exclusively running YARN,

Options:

- Copy a VM and rename to HadoopVM-YARN.
- Create another container

Install YARN.

By now, you should have two VM on your workstation or Two container:

For Me, the first VM hostname is hp.com and the second one is ht.com. Ensure to follow the same nomenclature to avoid confusion. Its very important.

Host/VM	Container	Remarks
hp.com	Hadoopo	YARN Services
ht.com	Sparko	Spark Client or Spark.

Using Docker:

```
#docker run -it --name hadoopo --privileged -p 8088:8088 -p 9870:9870 -p 9864:9864 -p 8032:8032 -p 8188:8188 -p 8020:8020 --hostname hadoopo centos:7 /usr/sbin/init
```

Verify the hostname and the /etc/hosts. You need to enter each IP and host name as shown above. Update details accordingly in your local machine.

```
[root@hp ~]# hostname  
hp.com  
[root@hp ~]# more /etc/hosts  
# Do not remove the following line, or various programs  
# that require network functionality will fail.  
#127.0.0.1          hp.com localhost  
#:1                  hp.com localhost6  
  
192.168.188.134 ht.com  
192.168.188.136 hp.com localhost  
[root@hp ~]#
```

You should see in your window as follows for ht.com. Changes the IP as your system.

```
[root@ht ~]# bash  
[root@ht ~]# hostname  
ht.com  
[root@ht ~]# more /etc/hosts  
# Do not remove the following line, or various programs  
# that require network functionality will fail.  
#127.0.0.1          localhost.localdomain localhost  
#:1                  localhost6.localdomain6 localhost6  
192.168.188.134 ht.com localhost  
192.168.188.136 hp.com  
[root@ht ~]#
```

All the below commands should be executed on hp.com unless specify. We are configuring YARN cluster now.

Change directory to the location where you have the software.

Download Location: (hadoop-3.2.2.tar.gz)  
<https://hadoop.apache.org/releases.html>

Untar as follows:

```
tar -xvf hadoop-X.tar.gz -C /opt  
tar -xvf jdk-8u40-linux-i586.tar.gz -C /opt
```

Rename the folder:

```
#mv hadoo* hadoop  
#mv jdk* jdk
```

--- Install JDK and set Java Home (Copy the bin file in the YARN folder) , To include JAVA\_HOME for all bash users , make an entry in /etc/profile.d as follows:

```
echo "export JAVA_HOME=/opt/jdk/" > /etc/profile.d/java.sh
```

Unpack the downloaded Hadoop distribution. In the distribution, edit the file /opt/hadoop/etc/hadoop/hadoop-env.sh to define some parameters as follows:

```
# set to the root of your Java installation  
  
export JAVA_HOME=/opt/jdk
```

```
# cd /opt/hadoop
```

Try the following command:

```
$ bin/hadoop
```

You need to modify some setting as follows: Replace with your hostname accordingly.

Use the following:

etc/hadoop/core-site.xml:

```
<configuration>
  <property>
    <name>fs.defaultFS</name>
    <value>hdfs://hadoop0:8020</value>
  </property>
</configuration>
```

etc/hadoop/hdfs-site.xml:

```
<configuration>
  <property>
    <name>dfs.replication</name>
    <value>1</value>
  </property>
</configuration>
```

## Setup passphraseless ssh

Now check that you can ssh to the localhost without a passphrase:

```
yum -y install openssh-server openssh-clients  
systemctl start sshd
```

Change the passwd using passwd command.

```
$ ssh localhost
```

If you cannot ssh to localhost without a passphrase, execute the following commands:

```
$ ssh-keygen -t rsa -P '' -f ~/.ssh/id_rsa  
$ cat ~/.ssh/id_rsa.pub >> ~/.ssh/authorized_keys  
$ chmod 0600 ~/.ssh/authorized_keys
```

copy the key to the slaves node:

```
scp ~/.ssh/id_rsa.pub master1:~/ssh/master.pub
```

```
[user@host1:~]# ... [user@host2:~]#
[root@master0 hadoop]# scp ~/.ssh/id_rsa.pub master1:~/ssh/master.pub
Warning: the ECDSA host key for 'master1' differs from the key for the IP address '172.18.0.3'

id_rsa.pub                                         100%  401   324.3KB/s  00:00
[root@master0 hadoop]#
```

Log on the slave node. Adding the master public key as an authroized key in the slave node.

```
[root@master1 ~]#
[root@master1 ~]#
[root@master1 ~]# cat ~/ssh/master.pub >> ~/ssh/authorized_keys
[root@master1 ~]#
```

Add the environment variable.

```
export HDFS_NAMENODE_USER="root"
export HDFS_DATANODE_USER="root"
export HDFS_SECONDARYNAMENODE_USER="root"
export YARN_RESOURCEMANAGER_USER="root"
export YARN_NODEMANAGER_USER="root"
```

**Format the filesystem:**

```
$ bin/hdfs namenode -format
```

**Start NameNode daemon and DataNode daemon:**

```
$ sbin/start-dfs.sh
```

```
[root@hadoop0 hadoop]# sbin/start-dfs.sh
Starting namenodes on [localhost]
Last login: Thu Jan 21 08:00:44 UTC 2021 from localhost on pts/2
Starting datanodes
Last login: Thu Jan 21 08:06:21 UTC 2021 on pts/2
Starting secondary namenodes [hadoop0]
Last login: Thu Jan 21 08:06:23 UTC 2021 on pts/2
hadoop0: Warning: Permanently added 'hadoop0,172.17.0.2' (ECDSA) to the list of known hosts.
[root@hadoop0 hadoop]#
```

1. Browse the web interface for the NameNode; by default it is available at:
  - o NameNode - <http://localhost:9870/>
2. Make the HDFS directories required to execute MapReduce jobs:

```
3. $ bin/hdfs dfs -mkdir /user
```

```
$ bin/hdfs dfs -mkdir /user/root
```

You can run a MapReduce job on YARN in a pseudo-distributed mode

## Start HDFS and YARN on the YARN Node: hp.com

1. Configure parameters as follows:

etc/hadoop/mapred-site.xml:

```
<configuration>
  <property>
    <name>mapreduce.framework.name</name>
    <value>yarn</value>
  </property>
  <property>
    <name>mapreduce.application.classpath</name>
    <value>$HADOOP_MAPRED_HOME/share/hadoop/mapreduce/*:$HADOOP_MAPRED_HOME/share/hadoop/mapreduce/lib/*
  </value>
  </property>
</configuration>
```

etc/hadoop/yarn-site.xml:

```
<configuration>
<property>
    <name>yarn.nodemanager.aux-services</name>
    <value>mapreduce_shuffle</value>
</property>
<property>
    <name>yarn.nodemanager.env-whitelist</name>
    <value>JAVA_HOME,HADOOP_COMMON_HOME,HADOOP_HDFS_HOME,HADOOP_CONF_DIR,CLASSPATH_PREPEND_DISTCACHE,HAD
OOP_YARN_HOME,HADOOP_MAPRED_HOME</value>
</property>
</configuration>
```

2. Start ResourceManager daemon and NodeManager daemon:

```
$ sbin/start-yarn.sh
```

```
[root@hadoop0 hadoop]# sbin/start-yarn.sh
Starting resourcemanager
Last login: Thu Jan 21 08:06:32 UTC 2021 on pts/2
Starting nodemanagers
Last login: Thu Jan 21 08:13:09 UTC 2021 on pts/2
[root@hadoop0 hadoop]#
```

3. Browse the web interface for the ResourceManager; by default it is available at:

- o ResourceManager - <http://localhost:8088/>

4. When you're done, you can stop the daemons with: Optional.

```
$ sbin/stop-yarn.sh
```

#verify with jps , all the above services should be there.

jps

```
[root@hadoop0 hadoop]# export PATH=$PATH:/opt/jdk/bin
[root@hadoop0 hadoop]# jps
1826 NodeManager
919 NameNode
1034 DataNode
1210 SecondaryNameNode
1708 ResourceManager
2174 Jps
[root@hadoop0 hadoop]#
```

Hadoop Node - Let us set some environment and path variable as follows: ( vi ~/.bashrc)

```
export HADOOP_HOME=/opt/hadoop  
export PATH=$HADOOP_HOME/bin:$PATH
```

Let us create a temporary folder, that will be used for working space for the YARN cluster.

```
hadoop fs -mkdir /tmp  
hadoop fs -chmod -R 1777 /tmp  
hadoop fs -mkdir /tmp/in  
hadoop fs -ls /tmp
```

You can get the README.md file from the Software folder, which is provided along with the training.

```
hadoop fs -copyFromLocal /opt/hadoop/README.txt /tmp/in  
hadoop fs -ls /tmp/in
```

```
#hadoop fs -mkdir /tmp/spark-events
```

Congrats! You have successfully configure Yarn Cluster.

If you are using docker, join the hadoopo and sparko containers in a single network:

```
#docker network connect spark-net hadoopo
```

Verify it:

```
#docker network inspect spark-net
```

```
"Containers": {
    "303b681436449f211ee3f828ec09af683947652bd1db52c68288e6ac75d71e04": {
        "Name": "spark0",
        "EndpointID": "56cfed9c11107e578a688ddab77af96e72c1063ebd2631bd801629f328b17e2",
        "MacAddress": "02:42:ac:12:00:02",
        "IPv4Address": "172.18.0.2/16",
        "IPv6Address": ""
    },

        "MacAddress": "02:42:ac:12:00:03",
        "IPv4Address": "172.18.0.3/16",
        "IPv6Address": ""
    }
},
"Options": {},
"Labels": {}
}
```

Start the Spark VM/spark container, if it's not yet started, i.e ht.com and issue the following command. Logon to the machine using telnet. You can use the VM, share folder options to copy the file to the VM from your workstation or else copy using the mouse from your workstation to the folder specify.

Let us copy the program, simple-project\_2.12-1.0.jar to the spark nodes. It was developed earlier.

Let us configure hadoop client setting on the Spark VM --> ht.com or sparko node.

Compress the Hadoop folder on the Hadoop instances or Hadoop node.

```
#cd /opt  
#tar -cvzf hadoop.tar hadoop/
```

Copy the compressed hadoop folder to the sparko or spark node and uncompressed in /opt folder.

[Docker:

```
copy from hadoop to host : docker cp hadoop:/opt/hadoop.tar .  
copy from host to spark : docker cp hadoop.tar sparko:/opt/]
```

```
#tar -xvf hadoop.tar
```

Update yarn-site.xml on the Spark Node. – Replace the RM hostname with that of your server.

```
<property>
  <name>yarn.resourcemanager.hostname</name>
  <value>mastero</value>
  <description>The hostname of the RM.</description>
</property>
<property>
  <name>yarn.resourcemanager.address</name>
  <value>mastero:8032</value>
  <description>The hostname of the RM.</description>
</property>
```

Create the following file in /opt on hadoop node and copy the file in to hdfs /user/root/input folder.

File names.json contains:

```
{"firstName":"Grace","lastName":"Hopper"}
{"firstName":"Alan","lastName":"Turing"}
 {"firstName":"Ada","lastName":"Lovelace"}
 {"firstName":"Charles","lastName":"Babbage"}
```

```
#hdfs dfs -mkdir /user/root/input  
# hdfs dfs -copyFromLocal /opt/names.json /user/root/input/
```

You can verify the file using the following command:

```
# hdfs dfs -ls -R /user/root/input
```

Open a command console to execute the Spark jobs to submit on YARN.  
Export Hadoop and Yarn environment variable pointing to the Spark Node – Hadoop conf file.

```
#cd /opt/spark/bin  
#export HADOOP_CONF_DIR=/opt/hadoop-spark/etc/hadoop  
#export YARN_CONF_DIR=/opt/hadoop-spark/etc/hadoop  
#./spark-submit --class "NameList" --master yarn --deploy-mode cluster  
/opt/data/simple-project_2.12-1.0.jar \  
    hdfs://hadoop0:8020/user/root/input1 hdfs://hadoop0:8020/user/root/output4  
or  
../spark-submit --class "NameList" --master yarn --driver-memory 1G --executor-memory 1G --num-  
executors 2 --deploy-mode cluster /opt/data/simple-project_2.12-1.0.jar \  
    hdfs://hadoop0:8020/user/root/input1 hdfs://hadoop0:8020/user/root/output7  
  
../spark-submit --class "NameList" --master yarn --driver-memory 512m --executor-memory 512m --  
num-executors 2 --deploy-mode cluster /opt/data/simple-project_2.12-1.0.jar \  
    hdfs://master0:8020/user/root/input hdfs://master0:8020/user/root/output7  
  
../spark-submit --class "NameList" --master yarn --driver-memory 512m --executor-memory 512m --  
num-executors 2 --deploy-mode client /opt/data/simple-project_2.12-1.0.jar \  
    hdfs://hadoop0:8020/user/root/input1 hdfs://hadoop0:8020/user/root/output7
```

or using spark-shell

Ensure that `HADOOP_CONF_DIR` or `YARN_CONF_DIR` points to the directory which contains the (client side) configuration files for the Hadoop cluster.

```
./bin/spark-shell --master yarn --deploy-mode client
```

Note --> Application Jar should be in the local file system, In folder is in HDFS and Out should not be present in the HDFS,it will be automatically created.

You can verify the progress of the application using <http://hp.com:8088/cluster>

Click on Cluster-->Application --> accepted

The screenshot shows the Hadoop Cluster UI at [http://hp.com:8088/cluster/app/application\\_1434297324587\\_0003](http://hp.com:8088/cluster/app/application_1434297324587_0003). The left sidebar has sections for Cluster (About, Nodes, Applications, Scheduler), Tools, and a collapsed section. The main area displays the Application Overview and Application Metrics for a running SPARK application, and a table for the ApplicationMaster.

**Application Overview:**

User:	root
Name:	com.ht.sparks.WordCount
Application Type:	SPARK
Application Tags:	
State:	RUNNING
FinalStatus:	UNDEFINED
Started:	14-Jun-2015 23:25:58
Elapsed:	3mins, 57sec
Tracking URL:	ApplicationMaster
Diagnostics:	

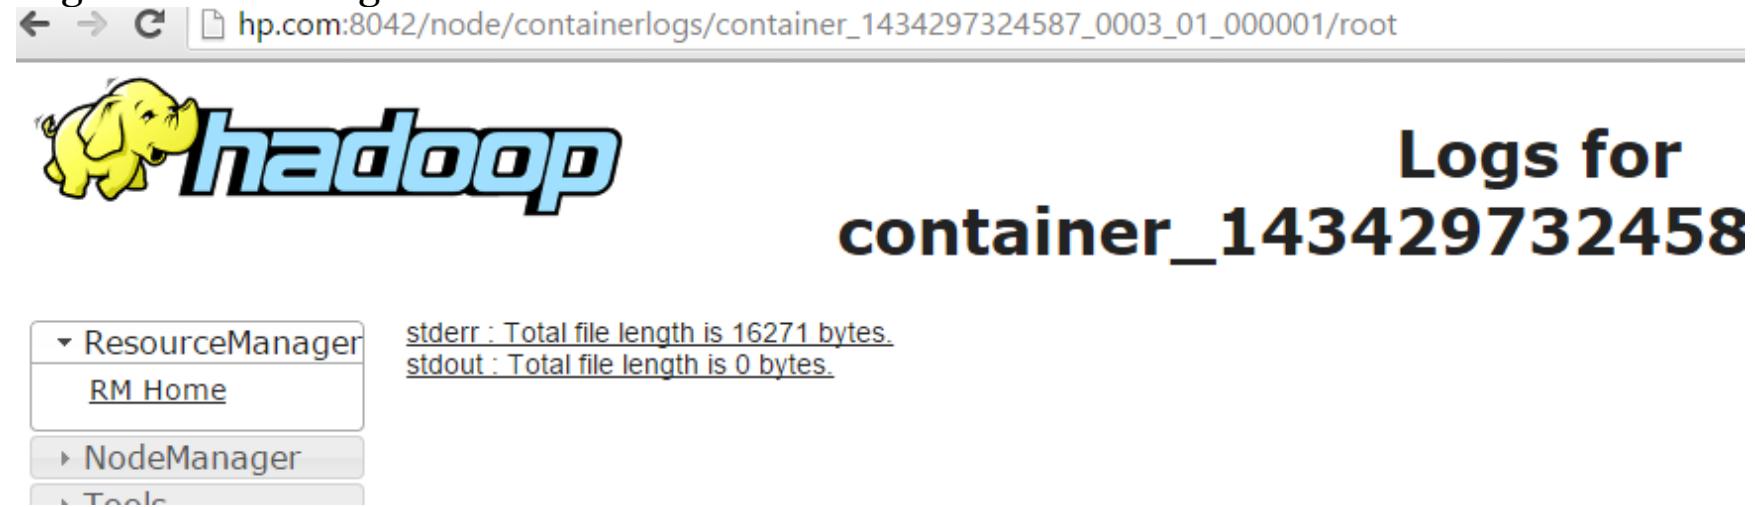

**Application Metrics:**

Total Resource Preempted:	<memory:0, vCores:0>
Total Number of Non-AM Containers Preempted:	0
Total Number of AM Containers Preempted:	0
Resource Preempted from Current Attempt:	<memory:0, vCores:0>
Number of Non-AM Containers Preempted from Current Attempt:	0
Aggregate Resource Allocation:	701453 MB-seconds, 459 vcore-seconds

**ApplicationMaster:**

Attempt Number	Start Time	Node	Logs
1	14-Jun-2015 23:25:58	hp.com:8042	<a href="#">logs</a>

Logs --> Stderr to get details as follows:

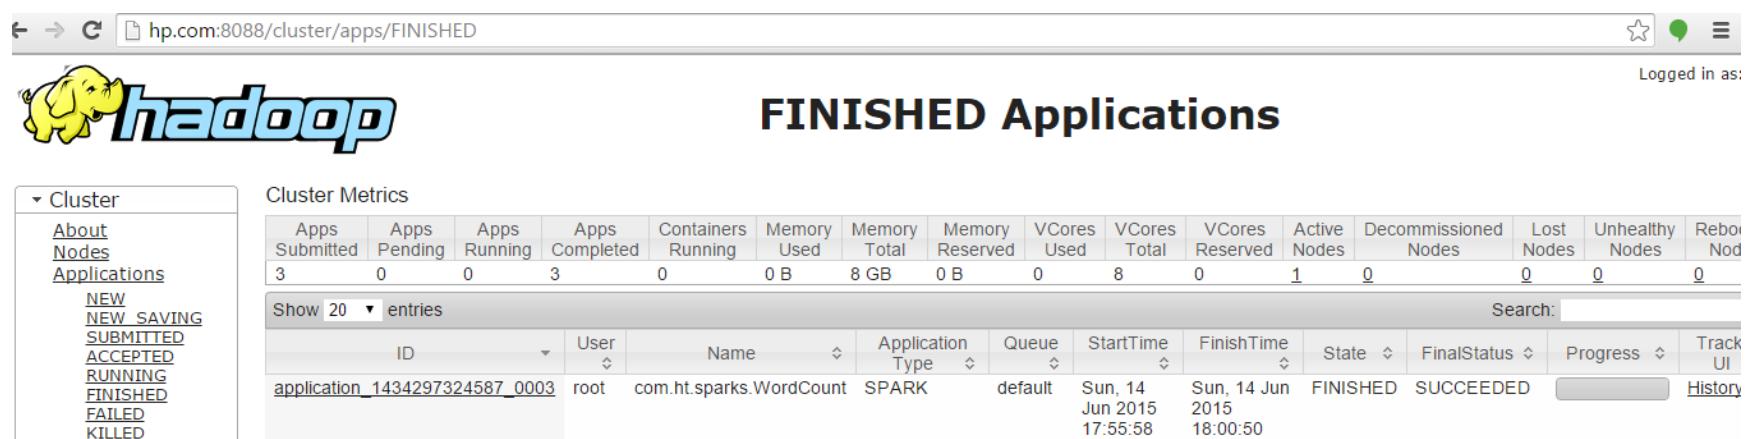

The screenshot shows the Hadoop ResourceManager (RM) interface. At the top, there's a navigation bar with back, forward, and refresh buttons, followed by a URL: [hp.com:8042/node/containerlogs/container\\_1434297324587\\_0003\\_01\\_000001/root](http://hp.com:8042/node/containerlogs/container_1434297324587_0003_01_000001/root). Below the URL is the Hadoop logo. To the right, it says "Logs for container\_143429732458". On the left, there's a sidebar with links for "ResourceManager" (selected), "RM Home", "NodeManager", and "Tools". The main content area displays log entries:

```

stderr : Total file length is 16271 bytes.
stdout : Total file length is 0 bytes.

```

**After sometimes click on Finished, after the console exit the program.**

The screenshot shows the Hadoop Cluster (CM) interface. At the top, there's a navigation bar with back, forward, and refresh buttons, followed by a URL: [hp.com:8088/cluster/apps/FINISHED](http://hp.com:8088/cluster/apps/FINISHED). To the right, it says "Logged in as: [username]". Below the URL is the Hadoop logo. The main content area says "FINISHED Applications". On the left, there's a sidebar with a "Cluster" section containing "About", "Nodes", "Applications" (which is expanded to show "NEW", "NEW SAVING", "SUBMITTED", "ACCEPTED", "RUNNING", "FINISHED", "FAILED", "KILLED"), and "Cluster Metrics". The "Cluster Metrics" table shows the following data:

Apps Submitted	Apps Pending	Apps Running	Apps Completed	Containers Running	Memory Used	Memory Total	Memory Reserved	VCores Used	VCores Total	VCores Reserved	Active Nodes	Decommissioned Nodes	Lost Nodes	Unhealthy Nodes	Reboot Nod
3	0	0	3	0	0 B	8 GB	0 B	0	8	0	1	0	0	0	0

Below the metrics, there's a table titled "Show 20 entries" with columns: ID, User, Name, Application Type, Queue, StartTime, FinishTime, State, FinalStatus, Progress, and Track UI. One row is shown:

ID	User	Name	Application Type	Queue	StartTime	FinishTime	State	FinalStatus	Progress	Track UI
application_1434297324587_0003	root	com.ht.sparks.WordCount	SPARK	default	Sun, 14 Jun 2015 17:55:58	Sun, 14 Jun 2015 18:00:50	FINISHED	SUCCEEDED		History

## On the job submit console.

ala:61)
```

Solution: Verify default configuration of the spark installation. /spark/spark-1.3.0-bin-hadoop2.4/conf/spark-defaults.conf

```
# Default system properties included when running spark-submit.
# This is useful for setting default environmental settings.

# Example:
spark.master          spark://ht.com:7077
spark.eventLog.enabled true
spark.eventLog.dir    hdfs://hp.com/tmp/spark-events
spark.serializer      org.apache.spark.serializer.KryoSerializer
# spark.driver.memory   5g
# spark.executor.extraJavaOptions -XX:+PrintGCDetails -Dkey=value -Dnumbers="one
two three"
~
```

Check that spark.eventLog.dir is begin with hdfs:// and the /tmp/spark-events is already created in HDFS system

You can verify on the YARN cluster only.

Verify using : hadoop fs -ls -R /tmp/

```
[root@hp ~]# hadoop fs -ls -R /tmp/
Java HotSpot(TM) Client VM warning: You have loaded library /YARN/hadoop-2.6.0/lib/native/libhadoop.so.1.0.0 which might have disabled stack guard. The VM will try to fix the stack guard now.
It's highly recommended that you fix the library with 'execstack -c <libfile>', or link it with '-z noexecstack'.

2) 15/06/14 00:41:20 INFO client.RMProxy: Connecting to ResourceManager at /0.0.0.0:8032

15/06/14 21:58:27 INFO yarn.Client: Application report for application\_1434297324587\_0002 (state: ACCEPTED)

Indefinite loop of above

**Solution:** Ensure that all configuration file are map to appropriate hostname and hostname to ip details are modified in the hosts file , Increase the resources and wait for few minutes to convert the status to running.

**Yarn-site.xml**

yarn.scheduler.minimum-allocation-mb: 256m  
yarn.scheduler.increment-allocation-mb: 256m

```
<property>
<name>yarn.nodemanager.resource.memory-mb</name>
<value>4096</value>
</property>
<property>
<name>yarn.scheduler.minimum-allocation-mb</name>
<value>512</value>
</property>
<property>
<name>yarn.scheduler.increment-allocation-mb</name>
<value>256</value>
</property>
```

**yarn-site.xml** – Spark Node. (Specify the hostname of the Hadoop RM Node as shown below)

```
<property>
  <name>yarn.resourcemanager.hostname</name>
  <value>hadoopo</value>
  <description>The hostname of the RM.</description>
</property>
```

```
<property>
  <name>yarn.resourcemanager.address</name>
  <value>hadoop:8032</value>
  <description>The hostname of the RM.</description>
</property>
```

3) If unhealthy nodes is being displayed in the cluster URL with 1/1 local-dirs are bad:  
/tmp/hadoop-yarn/nm-local-dir;

**Solution:** delete the folder using the following command and ensure that nodes are healthy before proceeding forward, you can restart if require

```
hadoop fs -rm -fr /tmp/hadoop-yarn/*
```

Try the following command:

```
yarn application -list
```

```
yarn application -kill [application name]
```

You can view jps in YARN cluster when spark job is executing. It will start Coarse\* processes.

```
[root@hp ~]# jps
5082 DataNode
9633 CoarseGrainedExecutorBackend
9670 Jps
4980 NameNode
5345 NodeManager
9625 CoarseGrainedExecutorBackend
5029 SecondaryNameNode
9420 ApplicationMaster
5294 ResourceManager
9629 CoarseGrainedExecutorBackend
[root@hp ~]#
```

Even, cluster mode works

```

---

**19. Jobs Monitoring : Using Web UI. – 45 Minutes**

Execute the Job as specified in the Spark standalone cluster lab/ Using Docker before proceeding ahead.

Copy the input file in both the nodes, if you are executing on the Standalone cluster.

Or start the Cluster and execute the following jobs:

The file should be in the Executing node.

File names.json contains:

```
{"firstName":"Grace","lastName":"Hopper"}  
 {"firstName":"Alan","lastName":"Turing"}  
 {"firstName":"Ada","lastName":"Lovelace"}  
 {"firstName":"Charles","lastName":"Babbage"}
```

Enter the following commands one at a time.

```
#spark-shell --master spark://spark0:8090  
val ip="/software/names.json"  
val op="/software/nameop"  
spark.sparkContext.setLogLevel("WARN")  
val peopleDF = spark.read.json(ip)  
val namesDF = peopleDF.select("firstName","lastName")
```

```
namesDF.write.option("header","true").csv(op)
```

<http://127.0.0.1:8080>

Click on Application ID → Application Detail UI

Spark shell - Spark Jobs **Application: Spark shell**

ID: app-20201113095544-0006  
**Name:** Spark shell  
**User:** root  
**Cores:** Unlimited (2 granted)  
**Executor Limit:** Unlimited (2 granted)  
**Executor Memory:** 1024.0 MiB  
**Executor Resources:**  
**Submit Date:** 2020/11/13 09:55:44  
**State:** RUNNING  
[Application Detail UI](#)

**Executor Summary (2)**

ExecutorID	Worker	Cores	Memory	Resources	State	Logs
1	worker-20201113080544-172.18.0.2-38441	1	1024		RUNNING	stdout stderr
0	worker-20201113080133-172.18.0.3-46519	1	1024		RUNNING	stdout stderr

Or You can verify the Jobs details Using: <http://master:4040/jobs/>

web UI comes with the following tabs (which may not all be visible at once as they are lazily created on demand, e.g. Streaming tab):

- Jobs
- Stages
- Storage with RDD size and memory use

- Environment
- Executors
- SQL

The **Jobs Tab** shows status of all Spark jobs in a Spark application

Display the timeline of Executor being added in the Job. When the Job Get completed etc. In above, you can verify that 2 executors have been added.

When you hover over a job in Event Timeline not only you see the job legend but also the job is highlighted in the Summary section.

The Event Timeline section shows not only jobs but also executors.

You can verify the completed and failed jobs too:

- Completed Jobs (2)  
Application: Spark shell

Completed Jobs (2)					
Application: Spark shell					
Job Id ▲	Description	Submitted	Duration	Stages: Succeeded/Total	Tasks (for all stages): Succeeded/Total
1	json at <console>:25 json at <console>:25	2020/11/13 09:59:47	3 s	1/1	1/1
2	csv at <console>:28 csv at <console>:28	2020/11/13 10:00:55	1 s	1/1	1/1

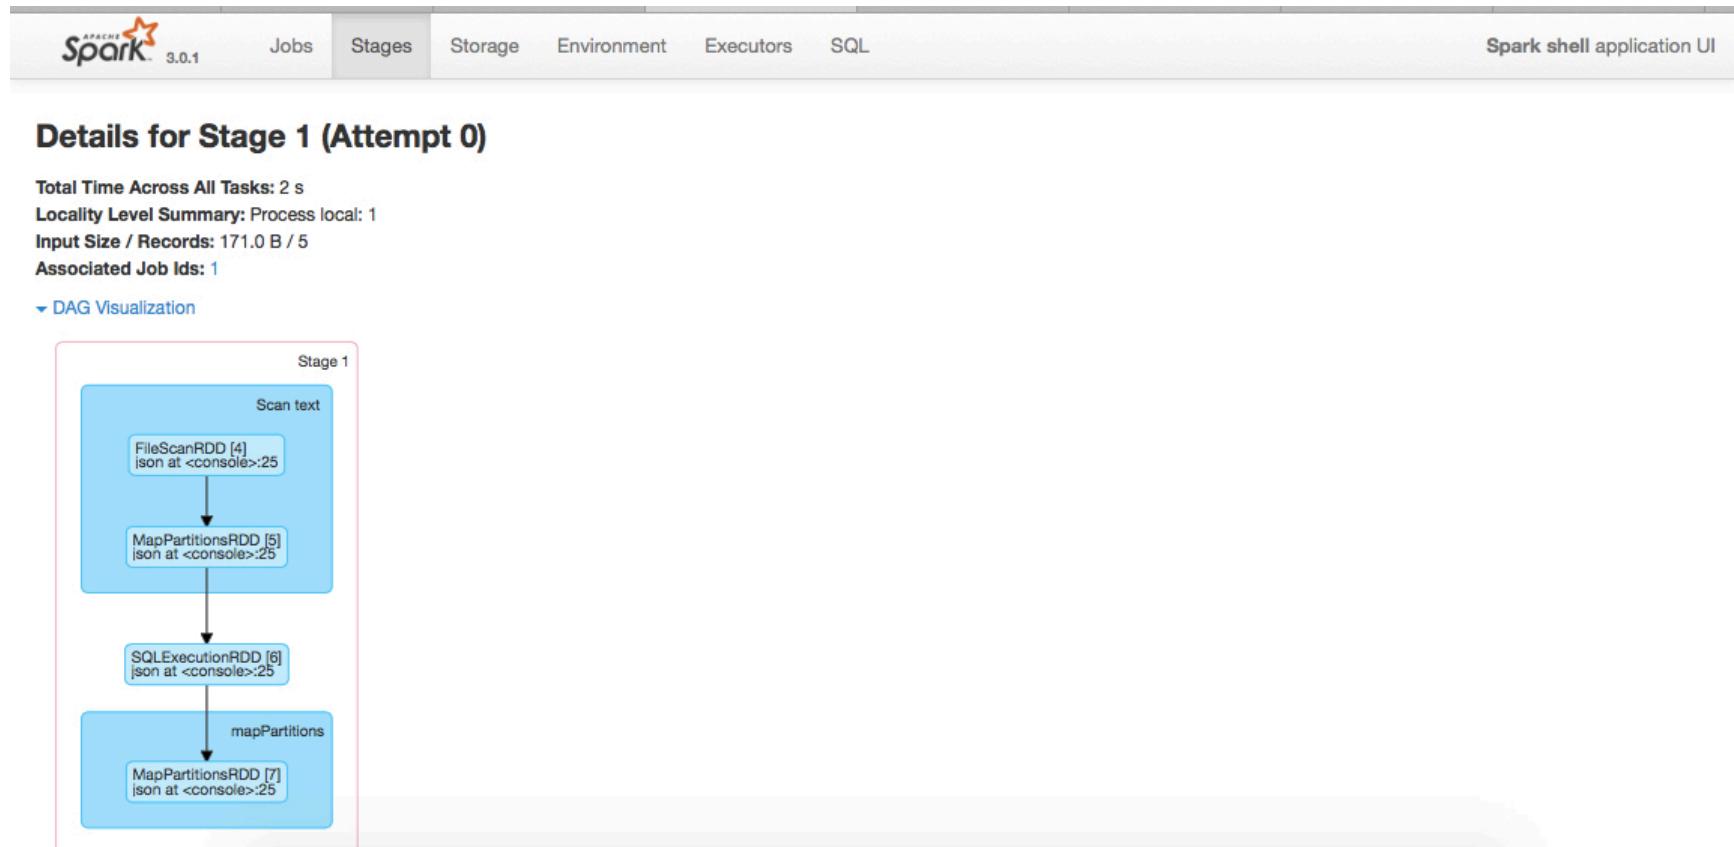

Page: 1 1 Pages. Jump to 1 . Show 100 items in a page. Go

- Failed Jobs (1)

Failed Jobs (1)					
Application: Spark shell					
Job Id ▼	Description	Submitted	Duration	Stages: Succeeded/Total	Tasks (for all stages): Succeeded/Total
0	json at <console>:25 json at <console>:25	2020/11/13 09:57:04	3 s	0/1 (1 failed)	0/1 (4 failed)

Page: 1 1 Pages. Jump to 1 . Show 100 items in a page. Go

Click on On job -> for details on Description → stages to view DAG - When you click a job in All Jobs Page page, you see the **Details for Job** page.

It shows the DAG graph and the stage details.

Scroll down to view the task metrics: which task take majority of the time etc. How much byte consume or output by each task and its statistics.

Showing 1 to 1 of 1 entries

Application: Spark shell Tasks by Executor

Show 20 entries Search:

Executor ID	Logs	Address	Task Time	Total Tasks	Failed Tasks	Killed Tasks	Succeeded Tasks	Blacklisted	Input Size / Records
1	stdout stderr	172.18.0.2:41887	3 s	1	0	0	1	false	171 B / 5

Showing 1 to 1 of 1 entries

Tasks (1)

Show 20 entries Search:

**20. Persisting Data – 40 Minutes**

In this lab, you will learn to cache the RDD and uncache it, when its done.

Data being used in this lab:

people.csv

pcode,lastName,firstName  
e,age  
02134,Hopper,Grace,52  
94020,Turing,Alan,22

pcodes.csv

pcode,city,state  
02134,Boston,MA  
94020,Palo  
Alto,CA  
87501,Santa

```
val over20DF = spark.read.option("header","true").csv("people.csv").where("age > 20")
val pcodesDF = spark.read.option("header","true").csv("pcodes.csv")
val joinedDF = over20DF.join(pcodesDF, "pcode").persist()
```

Fetch the records which pincode is “94020”

```
joinedDF.where("pcode = 94020").show()
joinedDF.where("pcode = 87501").show()
```

```

scala> val over20DF = spark.read.option("header","true").csv("people.csv").where("age > 20")

View the cache details using the URL - <http://127.0.0.1:4040/jobs/>

The screenshot shows the Spark shell application UI with the Storage tab selected. The page title is "Spark shell - Storage". The top navigation bar includes Jobs, Stages, Storage, Environment, Executors, and SQL. The right side of the header says "Spark shell application UI". Below the header, the word "Storage" is displayed in bold. A section titled "▼ RDDs" is expanded, showing a table with the following data:

ID	RDD Name	Storage Level	Cached Partitions	Fraction Cached	Size in Memory	Size on Disk
61	*(2) Project [PCODE#93, lastName#94, firstName#95, age#96, city#118, state#119] +- *(2) BroadcastHashJoin [PCODE#93, [PCODE#117], Inner, BuildRight :- *(2) Project [PCODE#93, lastName#94, firstName#95, age#96] : +- *(2) Filter ((isNotNull(age#96) AND (cast(age#96 as int) > 20)) AND isNotNull(PCODE#93)) : +- FileScan csv [PCODE#93,lastName#94,firstName#95,age#96] Batched: false, DataFilters: [isNotNull(age#96), (cast(age#96 as int) > 20), isNotNull(PCODE#93)], Format: CSV, Location: InMemoryFileIndex[file:/software/people.csv], PartitionFilters: [], PushedFilters: [IsNotNull(age), IsNotNull(PCODE)], ReadSchema: struct<PCODE:string,lastName:string,firstName:string,age:string> +- BroadcastExchange HashedRelationBroadcastMode(List <input[0, *(1)="" +-="" [id="#131]" [isnotnull(pcode#117)],="" [pcode#117,="" [pcode#117,city#118,state#119]="" batched:="" city#118,="" csv="" csv,="" datafilters:="" false,="" filescan="" filter="" format:="" isnotnull(pcode#117)="" locat...<="" project="" state#119]="" string,="" td="" true]]),=""><td>Disk Memory Deserialized 1x Replicated</td><td>1</td><td>100%</td><td>218.0 KIB</td><td>0.0 B</td></input[0,>	Disk Memory Deserialized 1x Replicated	1	100%	218.0 KIB	0.0 B
73	In-memory table `over20`	Disk Memory Deserialized 1x Replicated	1	100%	79.8 KIB	0.0 B
87	In-memory table `over201`	Disk Memory Deserialized 1x Replicated	1	100%	67.5 KIB	0.0 B

Changing the Persistence storage.

```
import org.apache.spark.storage.StorageLevel
joinedDF.persist(StorageLevel.DISK_ONLY)
```

```
joinedDF.unpersist()
joinedDF.cache()
```

```
scala>

scala> import org.apache.spark.storage.StorageLevel
import org.apache.spark.storage.StorageLevel

scala> joinedDF.persist(StorageLevel.DISK_ONLY)
20/11/11 06:56:26 WARN CacheManager: Asked to cache already cached data.
res19: joinedDF.type = [pcode: string, lastName: string ... 4 more fields]

scala> joinedDF.unpersist()
res20: joinedDF.type = [pcode: string, lastName: string ... 4 more fields]

scala> joinedDF.persist(StorageLevel.DISK_ONLY)
res21: joinedDF.type = [pcode: string, lastName: string ... 4 more fields]

scala> joinedDF.cache()
20/11/11 06:57:39 WARN CacheManager: Asked to cache already cached data.
res22: joinedDF.type = [pcode: string, lastName: string ... 4 more fields]

scala> |
```

Remove the table/view – over20 from cache.

From the web UI – storage section. You can verify the cache details. Currently there are two objects in cache.

Before:

The screenshot shows the Apache Spark 3.0.1 Storage UI. The top navigation bar includes tabs for Nisg, Inbox (4,677) - lifes..., spark scala using m..., Spark Development..., Edit Pad - Online Te..., Spark shell - Storage, (8) WhatsApp, Data Types - Spark..., and a plus sign for new tabs. Below the navigation bar, the Spark logo is visible along with Jobs, Stages, Storage, Environment, Executors, and SQL tabs. The Storage tab is selected. The main content area is titled "Storage" and contains a table under the "RDDs" section. The table has columns: ID, RDD Name, Storage Level, Cached Partitions, Fraction Cached, Size in Memory, and Size on Disk. Two rows are listed:

ID	RDD Name	Storage Level	Cached Partitions	Fraction Cached	Size in Memory	Size on Disk
73	In-memory table `over20`	Disk Memory Deserialized 1x Replicated	1	100%	99.3 KIB	0.0 B
87	In-memory table `over20`	Disk Memory Deserialized 1x Replicated	1	100%	87.0 KIB	0.0 B

Display the list of tables:

```
spark.catalog.listTables.show
```

```
spark.catalog.uncacheTable("overage")
```

After executing the above command: the above mention cache should be removed as shown below:

**Storage**▼ **RDDs**

ID	RDD Name	Storage Level	Cached Partitions	Fraction Cached	Size in Memory	Size on Disk
87	In-memory table `over201`	Disk Memory Deserialized 1x Replicated	1	100%	160.7 KiB	0.0 B

-----Lab Ends Here-----

-----

**21. Spark Streaming – Using Spark-Shell – 45 Minutes**

We will count the number of words in text data received from a data server listening on a TCP socket.

Start the spark console.

```
12310 ops
[root@hp spark-2.1.0]# bin/spark-shell --master local[2]
18/04/05 22:46:31 WARN Utils: Service 'SparkUI' could not bind on port 4040. Attempting port 4041.

scala> sc
res0: org.apache.spark.SparkContext = org.apache.spark.SparkContext@173b24c4

scala> █
```

First, we import the names of the Spark Streaming classes and some implicit conversions from StreamingContext into our environment in order to add useful methods to other

classes we need (like DStream). `StreamingContext` is the main entry point for all streaming functionality. We create a local StreamingContext with two execution threads, and a batch interval of 1 second.

```
import org.apache.spark._  
import org.apache.spark.streaming._
```

```
// Create a local StreamingContext with two working thread and batch interval of 10  
second.
```

```
// The master requires 2 cores to prevent from a starvation scenario.
```

```
val ssc = new StreamingContext(sc, Seconds(10))
```

Using this context, we can create a DStream that represents streaming data from a TCP source, specified as hostname (e.g. localhost) and port (e.g. 9999).

```
// Create a DStream that will connect to hostname:port, like localhost:9999
```

```
val lines = ssc.socketTextStream("localhost", 9999)
```

This lines DStream represents the stream of data that will be received from the data server. Each record in this DStream is a line of text. Next, we want to split the lines by space characters into words.

```
// Split each line into words
```

```
val words = lines.flatMap(_.split(" "))
```

flatMap is a one-to-many DStream operation that creates a new DStream by generating multiple new records from each record in the source DStream. In this case, each line will be split into multiple words and the stream of words is represented as the words DStream. Next, we want to count these words.

```
// Count each word in each batch
val pairs = words.flatMap(word => word.split(" ").map(w => (w, 1)))
val wordCounts = pairs.reduceByKey(_ + _)

// Print the first ten elements of each RDD generated in this DStream to the console
wordCounts.print()
```

The words DStream is further mapped (one-to-one transformation) to a DStream of (word, 1) pairs, which is then reduced to get the frequency of words in each batch of data. Finally, wordCounts.print() will print a few of the counts generated every second. Note that when these lines are executed, Spark Streaming only sets up the computation it will perform when it is started, and no real processing has started yet. To start the processing after all the transformations have been setup, we finally call

```
ssc.start()      // Start the computation
ssc.awaitTermination() // Wait for the computation to terminate
```

```
scala> val words = lines.flatMap(_.split(" "))
words: org.apache.spark.streaming.dstream.DStream[String] = org.apache.spark.streaming.dstream.FlatMappedDS
tream@650d5a3d

scala> val pairs = words.map(word => (word, 1))
pairs: org.apache.spark.streaming.dstream.DStream[(String, Int)] = org.apache.spark.streaming.dstream.Mappe
dDStream@53d94a6b

scala> val wordCounts = pairs.reduceByKey(_ + _)
wordCounts: org.apache.spark.streaming.dstream.DStream[(String, Int)] = org.apache.spark.streaming.dstream.
ShuffledDStream@490dc900

scala> wordCounts.print()

scala> ssc.start()          // Start the computation

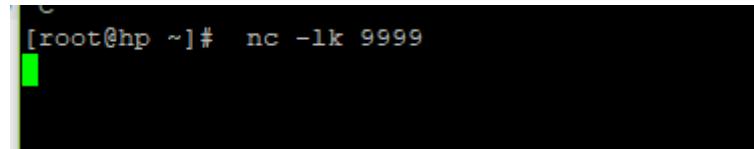

scala> ssc.awaitTermination() // Wait for the computation to terminate
-----
Time: 1522949060000 ms
```

The above window will be changed every 10 seconds.

Open a terminal and perform the following.

You will need to run Netcat (a small utility found in most Unix-like systems) as a data server by using

```
$ nc -lk 9999
```

Then, any lines typed in the terminal running the netcat server will be counted and printed on screen every second. It will look something like the following.

Type the following in the console:

I am going to send message through tcp and message will be printed on the spark console.

The screenshot shows two terminal windows. The left window is a root shell on an HP machine, with the command `nc -lk 9999` running. The right window is a spark shell session titled "root@hp:opt/mapr/spark/spark-2.1.0". It displays the output of a word count program. The output shows two distinct time points: `Time: 1522949240000 ms` and `Time: 1522949250000 ms`. Between these times, there are two warning messages from the RandomBlockReplicationPolicy and BlockManager. Below these, the word count results are listed. A note in the left window says "Then, any lines type like the following." followed by the words being sent: "I am going to send on the spark console through".

```
[root@hp ~]# nc -lk 9999
I am going to send message through tcp and the message will be printed on the spark console.
[1]+ 0 nc -lk 9999
```

```
root@hp:opt/mapr/spark/spark-2.1.0
-----
Time: 1522949240000 ms
-----
18/04/05 22:57:20 WARN RandomBlockReplicationPolicy: Expecting 1 replicas with only 0 peer/s.
18/04/05 22:57:20 WARN BlockManager: Block input-0-1522949240600 replicated to only 0 peer(s) instead of 1 peers
-----
Time: 1522949250000 ms
-----

```

----- Lab Ends Here -----

## 22. Streaming Apache Kafka Messages – 90 Minutes

Install and start kafka before proceeding ahead. Refer Annexure for this.

Create topic events and verify it with the following kafka commands:

```
#/opt/kafka/bin/kafka-topics.sh --list --bootstrap-server localhost:9092  
#/opt/kafka/bin/kafka-topics.sh --create \  
--bootstrap-server localhost:9092 \  
--partitions 8 \  
--topic events
```

```
[root@spark0 config]# /opt/kafka/bin/kafka-topics.sh --list --bootstrap-server localhost:9092  
  
[root@spark0 config]# /opt/kafka/bin/kafka-topics.sh --create \  
> --bootstrap-server localhost:9092 \  
> --partitions 8 \  
> --topic events  
Created topic events.  
[root@spark0 config]# /opt/kafka/bin/kafka-topics.sh --list --bootstrap-server localhost:9092  
events  
[root@spark0 config]#
```

Using spark 3.0.1 in shell only

Use the Spark-Shell Only. (Use the following version Only.)

```
#spark-shell --packages org.apache.spark:spark-sql-kafka-0-10_2.12:3.0.0  
org.apache.spark:spark-streaming-kafka-0-10_2.12:3.0.0
```

Execute the following commands to fetch records from Kafka.

```
#import spark.implicits._
```

```
#val inputDF =  
spark.readStream.format("kafka").option("kafka.bootstrap.servers","localhost:9092").optio  
n("subscribe", "events").option("startingOffsets", "earliest").option("checkpointLocation",  
"\tmp").load()  
  
#inputDF.printSchema()  
  
#inputDF.writeStream.format("console").option("truncate","false").start().awaitTerminatio  
n()
```
